# Advertising Sales Prediction Project

## 1. Title Page

Project Title: Advertising Sales Prediction using Machine Learning

Student Name: Sonam Kumari

Internship: Data Science Project

Institution: ino.Fortune IT.pvt.ltd

Date: 12-03-2026

## 2. Abstract

This project focuses on predicting product sales based on advertising budgets spent on different media platforms such as TV, Radio, and Social Media. Companies invest significant resources in marketing campaigns but often lack a clear understanding of how these investments influence actual sales performance. Using a dataset that contains advertising spending and corresponding sales data, this project applies data analysis and machine learning techniques to identify patterns and relationships between advertising channels and product sales. The project involves data cleaning, exploratory data analysis, visualization, and building a predictive model using Python libraries. The final outcome helps businesses understand which advertising platform contributes most to sales and supports better decision-making for marketing budget allocation.

## 4. Introduction

Advertising plays a crucial role in increasing product awareness and driving sales. Businesses allocate significant budgets across different advertising platforms such as television, radio, and social media. However, understanding the effectiveness of each platform in generating sales is often challenging. Data analytics and machine learning techniques can help analyze historical advertising data and uncover patterns that explain how advertising expenditure influences product sales. This project aims to analyze advertising data and build a predictive model that estimates product sales based on advertising spending.

## 5. Problem Statement

Companies invest money in advertising across different media platforms, but they often do not know how much sales these advertisements will generate. Without proper analysis, it is difficult to determine which advertising channel contributes the most to sales growth. Therefore, there is a need to build a predictive model that analyzes advertising budgets and predicts product sales.

## 6. Objectives

Analyze the relationship between advertising spending and product sales.

Understand the impact of TV, Radio, and Social Media advertising on sales.

Perform exploratory data analysis to identify trends and patterns.

Build a machine learning model to predict product sales.

Provide insights to help businesses optimize their advertising budgets.

## 7. Dataset Description

The dataset used in this project contains advertising budgets spent on different media platforms including **TV, Radio, and Social Media** along with the corresponding product **sales values**.

The dataset is in Excel/CSV format and includes multiple rows representing different advertising campaigns. Each column represents a variable such as advertising budget for a specific platform and the resulting sales.

## 8. Tools & Technologies Used

Programming Language: Python

Libraries: Pandas, NumPy, Matplotlib, Seaborn, Scikit-learn

Development Environment: Python IDE

Visualization: Matplotlib and Seaborn

## 9. Methodology

Data Collection – Import the advertising dataset.

Data Cleaning – Handle missing values and formatting issues.

Exploratory Data Analysis – Understand relationships between variables.

Data Visualization – Plot graphs to identify trends.

Model Building – Train a regression model to predict sales.

Model Evaluation – Evaluate performance using metrics such as $R^2$ score.

Result Interpretation – Analyze the influence of advertising channels.

## 10. Data Cleaning

Data cleaning involves checking the dataset for missing values, duplicate rows, and inconsistent formatting. Any missing or incorrect values are handled appropriately to ensure the dataset is accurate and suitable for analysis.

## 11. Exploratory Data Analysis

Exploratory Data Analysis (EDA) is performed to understand the relationships between advertising budgets and sales. Various visualizations such as scatter plots and correlation heatmaps are used to identify trends and patterns in the dataset.

## 12. Results / Output

The machine learning model predicts product sales based on advertising budgets. The model performance is evaluated using metrics such as $R^2$ score to determine how well the model explains the variation in sales.

## 13. Challenges

Some challenges in this project include understanding the relationships between multiple advertising channels and sales, selecting an appropriate machine learning model, and interpreting the model results effectively.

## 14. Recommendations

Based on the analysis, companies should allocate advertising budgets strategically across platforms that show a stronger impact on sales. Data-driven marketing decisions can significantly improve return on investment.

## 15. Conclusion

This project demonstrates how data analytics and machine learning can help businesses predict product sales based on advertising budgets. By analyzing advertising data, companies can better understand which platforms drive sales and optimize their marketing strategies.

## 16. Future Scope

In the future, the model can be improved by incorporating more advertising channels, using larger datasets, and applying advanced machine learning techniques to achieve more accurate predictions.
